Data Quality & Reliability Diagnosis

Outliers in "total" Column:

- Wide Range:** Orders span from \$32.62 to \$127,262.02, a difference of nearly 4,000x between minimum and maximum values
- Potential High-Value Outliers:** The maximum value (\$127,262.02) is approximately 4.4x higher than the average (\$28,704.99), suggesting exceptionally large orders that may skew aggregate analyses
- Distribution Skew:** Right-skewed distribution where a small number of high-value orders could disproportionately influence summary statistics

Data Quality (Null or Inconsistent Values):

- Completeness:** No explicit nulls detected in the "total" column, but comprehensive null-value audits across all columns are recommended
- Potential Inconsistencies:** The extreme range suggests possible data quality issues — very low values (\$32.62) may indicate partial orders or test data, while very high values could represent bulk orders or data entry errors
- Validation Gaps:** Without business rules validation, it's unclear if all "total" values represent legitimate complete orders

Readiness Assessment:

⚠️ NOT READY FOR PRODUCTION ANALYSIS WITHOUT TREATMENT

The orders table requires preprocessing before reliable analysis:

Required Treatment:

- Outlier detection and handling (remove or flag extreme values)
- Null-value audit across all columns
- Data validation against business rules (minimum order thresholds, maximum caps)
- Duplicate detection and deduplication

Recommended Relationships:

- Customer dimension** — to segment by customer type, geography, or behavior
- Product/line items** — to understand what drives high-value orders
- Time dimension** — to identify seasonal patterns or date-based anomalies
- Payment/status tables** — to filter for completed vs. cancelled orders

Without these relationships, analyses will be limited to aggregate order-level insights and miss critical business context.
